

## Joining the VMobility Network for the First Time

Below is an illustration of the VMobility desktop icon that will appear on your desktop after rebooting during the installation process.

**Step 1:** Select the VMobility desktop shortcut icon (has a shortcut arrow in the left hand corner.)

Illustrated below is the VMobility Client. We will discuss its features (Desktop Sharing, File Sharing, etc.) in the next demos.

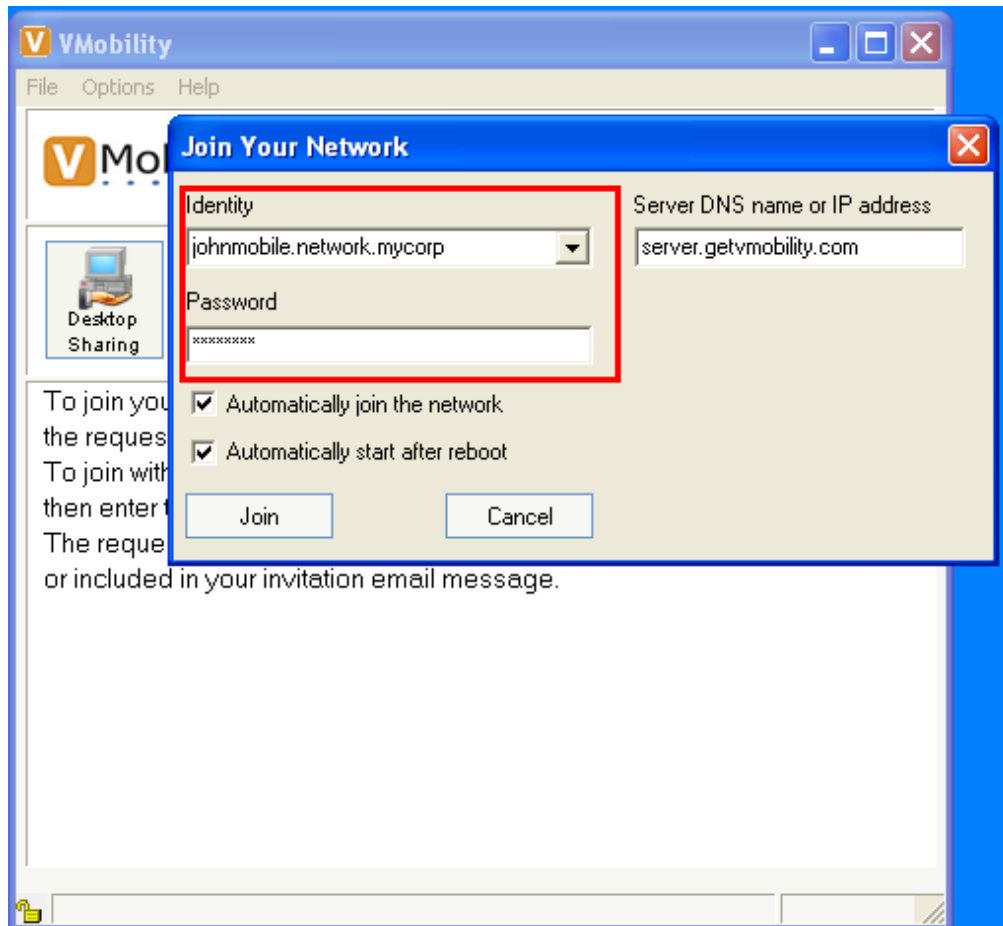

**Step 2:** Select **Join As**

In the example below John is joining the network for the first time

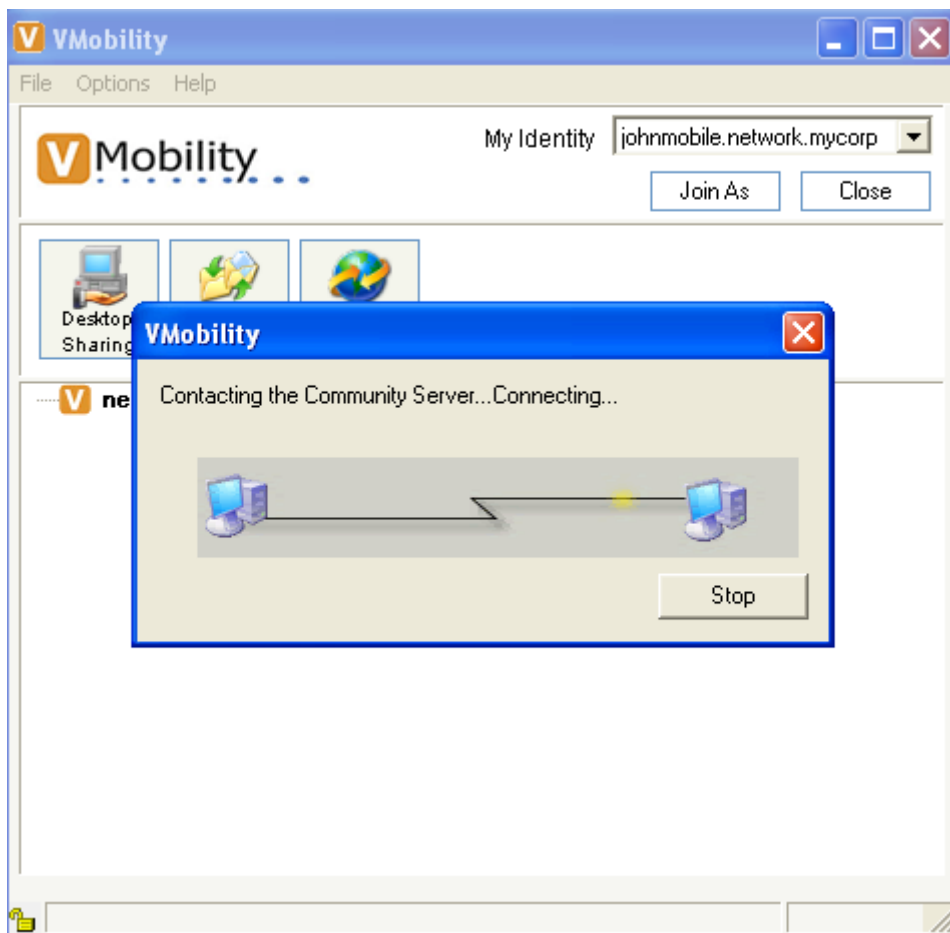

**Note:** After logging in for the first time into your network, your identity is saved on your VMobility Client and you only need to enter the password when you log in the next time.

**Step 3:** Enter the Identity and Password that was given to you in your invitation email. It is important that you enter the Identity and Password exactly as given with no extra spaces, otherwise you get the following. Select **Join** to log into the network

You also have the option to **Automatically join the network**. By default, **Automatically start after reboot** is checked. It is advisable that both of these are checked if you are accessing another system remotely. This way if there is a power outage and the system reboots, the system will automatically be logged in so you can continue to access it remotely.

The following pop-up will appear.

You can see that John whose identity is “**johnmobile.network.mycorp.**” is now logged into the network. In the example below two members are already logged in.
